1. INTRODUCTION

The Paroscientific DigiPort is a High Performance Pressure Port that serves as a termination device permitting DigiQuartz® barometers to accurately measure the true atmospheric pressure in the presence of wind.

According to the World Meteorology Organization,

A barometer will not give a true reading of the static pressure if it is influenced by gusty winds. Its reading will fluctuate with the wind speed and direction. At sea, error is always present due to the ship's motion. A similar problem will arise if the barometer is installed in an air-conditioned room.” Air conditioning may create a pressure differential between the inside and outside of a room. Therefore, if a barometer is to be installed in an air-condition room, it is advisable to use a static head with the barometer.

These dynamic fluctuations are superimposed on the static pressure and, with a strong and gusty wind, may amount to 2 or 3 hPa. It is usually impractical to correct for such fluctuations because the “pumping” effect on the mercury surface is dependent on both the direction and the force of the wind, as well as on the local circumstances of the barometer's location. Thus the “mean value” does not only represent the true static pressure. When comparing barometers, the possibility of a difference in readings due to the wind effect should be borne in mind.¹

Accurate measurements of barometric pressure require an environmentally rugged pressure port design that minimizes pressure errors under dynamic wind conditions. Wind tunnel and field tests of the DigiPort show superior performance over all other ports. Barometric readings with the DigiPort easily meet the requirements of GPS Meteorology, Weather Stations, Digital Altimeter Setting Indicators, High-Resolution Measurements of Atmospheric Waves, and Aircraft Wake-Turbulence Detection.

Please access Paroscientific website at <http://www.paroscientific.com> to obtain a copy of the test report comparing various pressure ports in a wind-tunnel test.

2. PRODUCT SPECIFICATIONS

The DigiPort product is defined by Specification Control Drawing 7010-001. Specifications are subject to change without notice.

2.1 Performance Characteristics:

Wind Dependence	
Wind Speed	Max Wind Effect
5 meters/sec (10 knots)	0.01 hPa
10 meters/sec (20 knots)	0.03 hPa
20 meters/sec (40 knots)	0.12 hPa

Wind speed tested: 0 to 60 meters/sec (120 knots)

Wind Pitch or tilt range: $\pm 25^\circ$

2.2 Physical Characteristics:

Material: Aluminum with polyurethane white surface

Outer disk diameter: 7.0 in. (18 cm)

Outer disk spacing: 2.8 in. (7 cm)

Weight: 5 lb. (2.3 Kg) maximum

Operating Temperature: -50°C to $+60^\circ\text{C}$ (-58°F to $+140^\circ\text{F}$)
(with optional hose)

Humidity: 0-100%, condensing and non-condensing

Rain: Self-draining holes protected from rain

Condensation: Moisture Trap provided

Ice and biological contamination: Multiple redundant holes keep port open

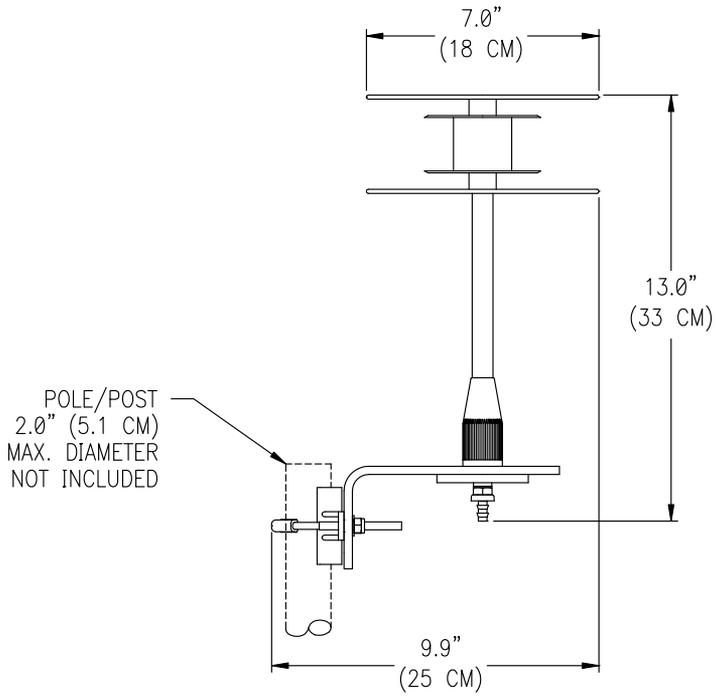

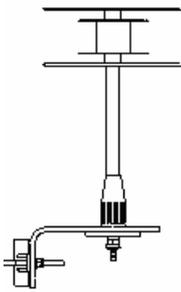

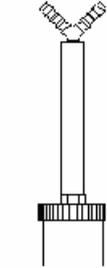

Fig. 2- Port Dimensions

3. ITEMS INCLUDED WITH THE DIGIPOINT

Port Assembly

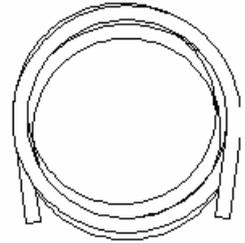

Moisture Trap

1/4 Hose to
1/8 A-Lok Adapter
(see table below)

1/4 Hose to
1/4 Tube Adapter
(see table below)

1/4" ID Parker
Push-Lok Hose
(see table below)

3.1 DigiPort Part Number Configurations

Items included with the DigiPort are dependent on the part number ordered as shown in the following table.

Part Number	Hose Included **	For Use With	Adapter(s) Included
1745-000	None	765-16B	1/4 Hose to 1/4 Tube Adapter
1745-003	3 Meters	760-16B	
1745-005	5 Meters		
1745-010	10 Meters		
1745-100	None	1000-16B	1/4 Hose to 1/8 A-Lok Adapter
1745-103	3 Meters	6000-16B	
1745-105	5 Meters	745-16B	
1745-110	10 Meters	740-16B	

** Included hose is 1/4" Parker Push-Lok Hose

4. ASSEMBLY OVERVIEW

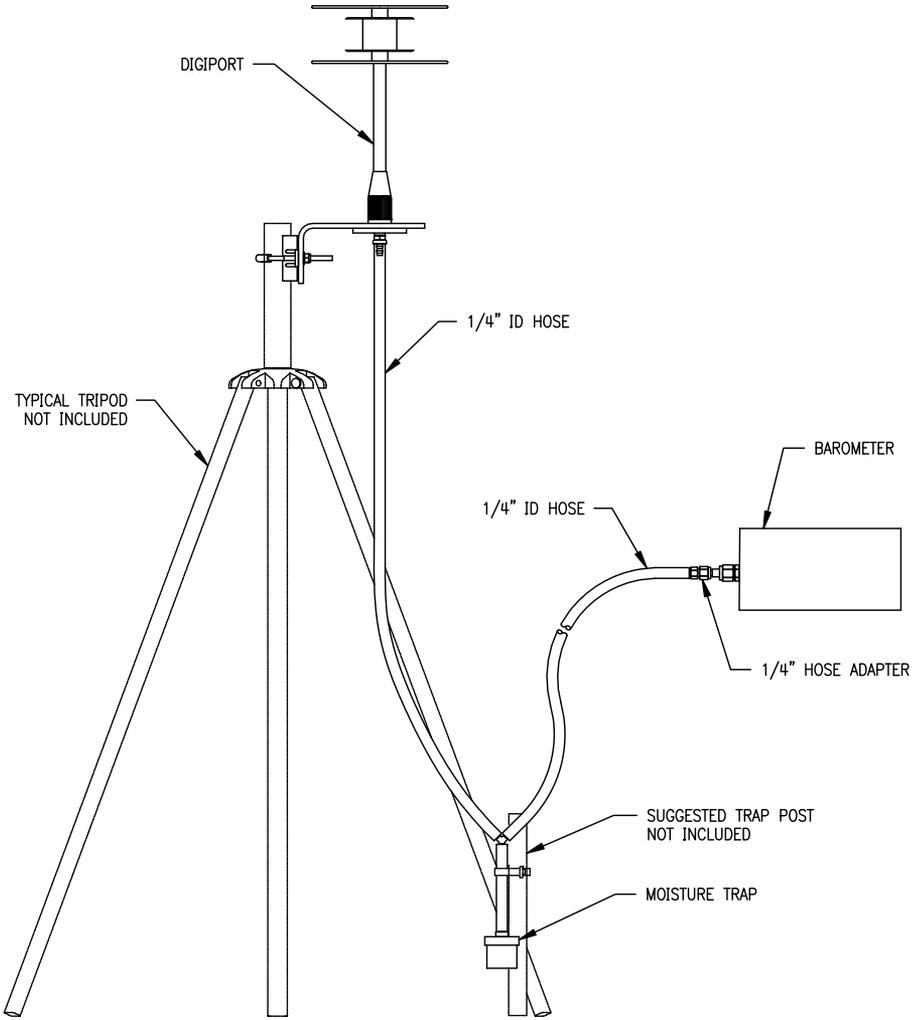

Fig. 4- Assembly Overview

5. INSTALLATION

This section discusses installation of the DigiPort and connecting it to a Paroscientific DigiQuartz® barometer.

5.1 Mounting the DigiPort

Install the mounting bracket of the DigiPort on a pole not more than 2 inches in diameter. Be sure the mounting fixture and structure are capable of securely supporting the DigiPort under adverse weather conditions.

The DigiPort must be installed in a vertical orientation as shown below. This position will assure optimum performance of the port.

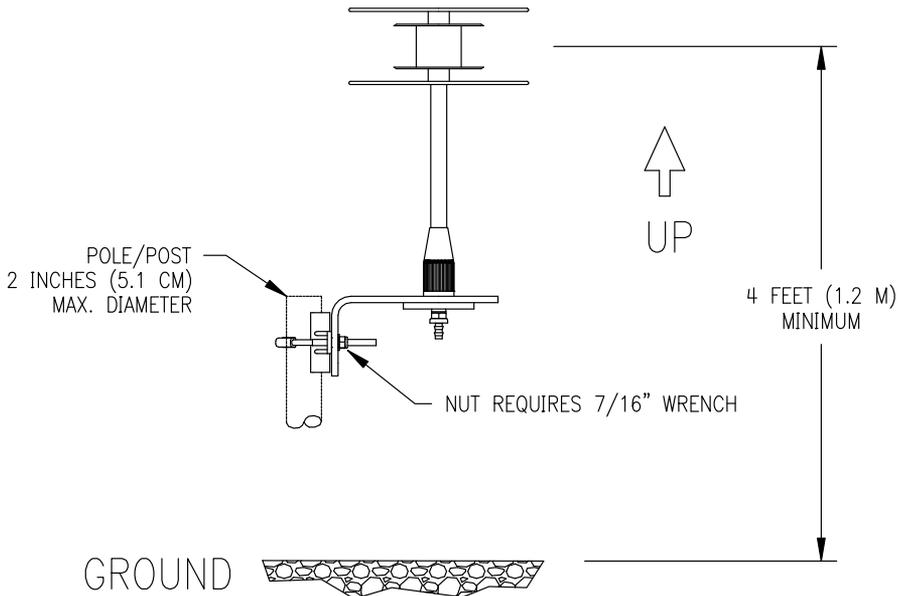

Figure 5.1- DigiPort Mount

Install the unit in a location where the ports remain unobstructed. Maintain at least one foot of clearance in all directions and at least four feet of clearance from the ground. Obstruction of the ports may result in erratic performance. The distance from the port to the top of the mounting post should be at least 10 times the diameter of the post. Tighten nuts with a 7/16" wrench.

5.2 Installing the Hose and Moisture Trap

It is essential to install the provided Moisture Trap to prevent any condensation from obstructing air passage through the hose. Position the barometer and the DigiPort and route the connecting hose in such a way that ensures there is a single low point in the connecting hose for condensed moisture to collect. Locate and install the Moisture Trap at that point. Failure to do so may result in damage to the barometer and/or inaccurate pressure readings.

If possible, locate the moisture trap in an area that is protected from harsh conditions. If the trap will be installed outdoors, it is recommended that it be secured to something fixed such as the stake depicted in Figure 5.2.

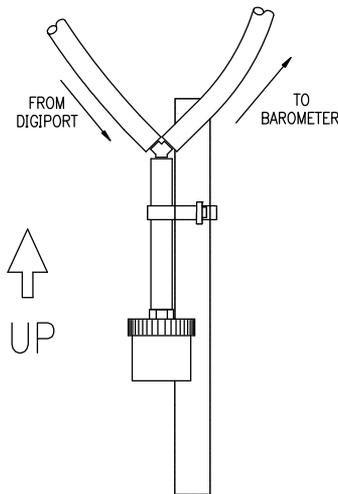

Fig. 5.2- Moisture Trap

Using a sharp cutting tool, cut an appropriate length of 1/4" ID hose such that it will comfortably reach between the port and the trap without having low spots where condensation could collect. Cut a second length of hose to connect between the trap and the DigiQuartz® barometer port in a similar manner. Push the ends of each length of hose over the barbed ends of the Moisture Trap wye until they are seated securely. Other than the Moisture Trap being vertical, orientation is not important.

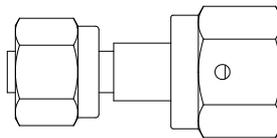

NOTE: A compliant 1/4" ID (inside diameter) hose is needed for installation. You may need to obtain an appropriate hose if your configuration did not include one. For reference, the standard hose included with the DigiPort is a Parker Push-Lok 801-4 Color-Coded Hose. Any similar hose is acceptable.

5.3 Connecting to the Digiquartz® Barometer

An adapter is required to connect the 1/4" ID hose to the port of a Paroscientific Digiquartz® barometer. Paroscientific barometers use one of two kinds of ports as depicted in the following table.

Digiquartz® Barometer Model	Port Type	
Model 765-16B Model 760-16B	Swagelok 1/4" VCO	See para. 5.3.1
Model 1000-16B Model 6000-16B Model 745-16B Model 740-16B	Parker 1/8" A-Lok	See para. 5.3.2

5.3.1 For barometers with a 1/4" VCO fitting, an adapter is provided to join 1/4" tubing to 1/4" hose. This requires the use of the 1/4" VCO to 1/4" Tube Adapter accessory that is included with these barometers (pictured below).

**Fig. 5.3.1a- Tube Adapter
Models 760 & 765**

Use this adapter with the provided barbed hose adapter to connect the hose to the barometer as shown below.

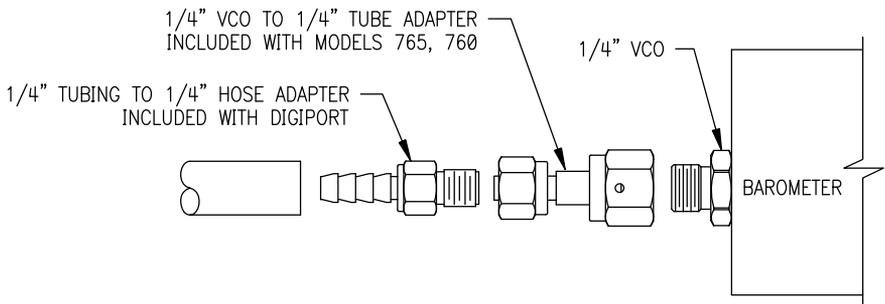

Fig. 5.3.1b- 1/4" VCO Connection

Attach the adapters to the barometer and press the hose all the way onto the barbed hose fitting.

5.3.2 For barometers with a 1/8" A-Lok fitting, a two-piece adapter is provided to join a 1/8" A-Lok fitting to 1/4" Hose as shown below.

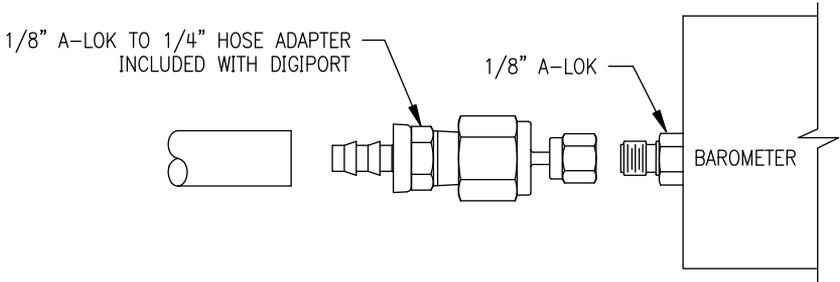

Fig. 5.3.2- 1/8" A-Lok Connection

Attach the adapter to the barometer and press the hose all the way onto the barbed hose fitting.

6. MAINTENANCE

The DigiPort is a highly reliable instrument designed to operate for a long period of time without the need for maintenance. Ensuring that the DigiPort remains clean and debris-free will ensure the greatest overall performance.

Periodic cleaning of the port inlets and ensuring an unobstructed path at the moisture trap are the only recommended maintenance items for this unit.

6.1 Barometer Port Inlet Cleaning

Clear out any debris that has collected between the upper and lower plates, including the adjacent orifice plates. Check that flow is not obstructed through the port assembly. If flow is obstructed, disassemble the upper plate and upper orifice plate by unscrewing the 7/16-20 UNF flat head socket screw on top of the port. Use a 5/16" Allen hex wrench. This provides access to both orifice plates and the interior of the upper end of the column. See Figure 6.1 below.

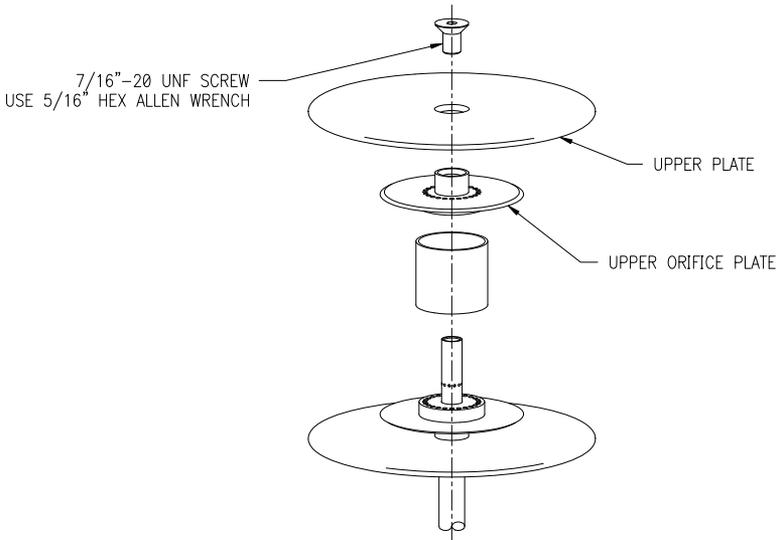

Fig. 6.1

Remove any debris from the various orifices and reassemble, applying a small amount of thread-locking compound to the screw. Torque the screw to 25 inch-lb to secure the assembly.

6.2 Clearing the Moisture Trap

Although unlikely, it is possible for the hose to become obstructed if a sufficient amount of condensed moisture or airborne contamination accumulates in the moisture trap. As needed, unscrew the jar from the lid of the moisture trap to remove any such accumulation. The connecting silicone tubing may also be detached from the hose wye and rinsed clean as needed.

7. TECHNICAL SUPPORT

For additional technical support please contact an application engineer at:
